

NAME: Naishadh Parikh

Assignment: DNS Server Configuration in Windows Server

1. Install the DNS Server Role

Steps:

1. Open Server Manager.
2. Click Manage → Add Roles and Features.
3. Click Next until you reach the Server Roles page.
4. Select DNS Server.
5. Click Add Features when prompted.
6. Click Next until the Confirmation page.
7. Click Install.
8. Wait for the installation to complete and click Close.

Result: The DNS Server role is installed successfully.

2. Create a Forward Lookup Zone and Add an A Record

Steps:

1. Open Server Manager → Tools → DNS.
2. Expand your server name.
3. Right-click Forward Lookup Zones → New Zone.
4. Click Next.
5. Select Primary Zone and click Next.
6. Enter the zone name as foodies.local.
7. Keep the default settings and click Finish.
8. Right-click foodies.local → New Host (A or AAAA).
9. Enter the following details:
 - Name: zomato
 - IP Address: 192.168.1.50
10. Click Add Host and then Done.

3. Create a CNAME Record

Steps:

1. Right-click foodies.local.
2. Select New Alias (CNAME).
3. Enter:
 - Alias Name: swiggy
 - Fully Qualified Domain Name (FQDN) for Target Host: zomato.foodies.local
4. Click Browse to select the target host (optional) or type it manually.
5. Click OK.

Verify Using nslookup

Open Command Prompt on the client machine and run:

```
nslookup zomato.foodies.local
```

```
nslookup swiggy.foodies.local
```

Result: The swiggy.foodies.local alias successfully points to zomato.foodies.local.

4. Simulate DNS Resolution

Commands

```
nslookup zomato.foodies.local
```

```
nslookup swiggy.foodies.local
```

Observation

- nslookup zomato.foodies.local returns the IP address **192.168.1.50** because it is an **A Record**.
- nslookup swiggy.foodies.local first resolves the **CNAME** to **zomato.foodies.local** and then returns the same IP address **1**
